## CLAIM LISTING

 (Original) A circuit for computing a product of a constant and a mixed number power of two, said mixed number comprising an integer portion and a fraction portion, said circuit comprising:

a first register for storing the constant;

 $\hbox{a second register for storing the integer portion} \\$  and the fraction portion;

a memory for storing a plurality of values, each of said plurality of values corresponding to a particular one of a corresponding plurality of fractions, wherein each one of said plurality of values is two to the exponential fraction corresponding to the one of said plurality of values;

a third register for storing a particular one of the plurality of values, said particular one of the plurality of values corresponding to the fraction portion;

a multiplier circuit for multiplying the contents of the third register by the contents of the first register, thereby resulting in a product; and

the product being shifted a certain number of times, the certain number of times equal to the integer portion.

(Original) The circuit of claim 1, wherein the second register comprises:

- a first one or more bits for storing the integer portion; and
- a second one or more bits for storing the fraction portion.
- 3. (Original) The circuit of claim 2, further comprising:
- a shift register for storing the product and shifting the product the certain number of times.
- (Original) The circuit of claim 3, wherein the first one or more bits are decremented after each shift of the shift register.
- 5. (Original) The circuit of claim 4, wherein the shift register shifts until the first one or more bits are decremented to zero.
- 6. (Original) The circuit of claim 1, wherein the plurality of values comprises at least four values.
- 7. (Currently Amended) A method for computing a product of a constant and a mixed number power of two, said mixed number comprising an integer portion and a fraction portion, said method comprising:

receiving the constant;

receiving the integer portion

receiving the fraction portion;

providing the fraction portion to a memory storing a plurality of values, each of said plurality of values corresponding to a particular one of a corresponding plurality of fractions, each one of said plurality of values being two to the exponential fraction corresponding to the one of said plurality of values;

receiving a particular one of the plurality of values, said particular one of the plurality of values corresponding to the fraction portion;

multiplying the constant by the particular one of the plurality of values, thereby resulting in a product; and

shifting the product a certain number of times, the certain number of times equal to the integer portion; and

 $\underline{\text{decompressing audio data, based on the shifted}}$  product.

8. (Original) The method of claim 7, further comprising:

decrementing the constant after shifting the product.

- 9. (Original) The method of claim 8, further comprising shifting until the constant is decremented to
- 10. (Original) The method of claim 7, wherein the plurality of values comprises at least four values.
- 11. (Currently Amended) A video decoder for decoding compressed video data, said video decoder comprising:
  - a Huffman decoder for decoding quantized coefficients;
- ainverse quantizern an inverse quantizer for inverse
  quantizing the quantized coefficients inverse quantizer,
  thereby resulting in inverse quantized coefficients; and
- a rescaler for scaling the inverse quantized coefficients, said rescaler further comprising:
  - a first register for storing a constant;
- a second register for storing an integer portion and a fraction portion;
- a memory for storing a plurality of values, each of said plurality of values corresponding to a particular one of a corresponding plurality of fractions, each one of said plurality of values being two to the exponential fraction corresponding to the one of said plurality of values;

- a third register for storing a particular one of the plurality of values, said particular one of the plurality of values corresponding to the fraction portion;
- a multiplier circuit for multiplying the contents of the third register by the contents of the first register, thereby resulting in a product; and

the product being shifted a certain number of times, the certain number of times equal to the integer portion.

- 12. (Original) The video decoder of claim 11, wherein the second register comprises:
- $% \left( 1\right) =\left( 1\right) \left( 1\right)$  a first one or more bits for storing the integer portion; and
- a second one or more bits for storing the fraction portion.
- 13. (Original) The video decoder of claim 12, wherein the inverse quantizer further comprises:
- a shift register for storing the product and shifting the product the certain number of times.
- 14. (Original) The video decoder of claim 13, wherein the first one or more bits are decremented after each shift of the shift register.

- 15. (Original) The video decoder of claim 14, wherein the shift register shifts until the first one or more bits are decremented to zero.
- 16. (Original) The video decoder of claim 11, wherein the plurality of values comprises at least four values.
- 17. (New) The method of claim 7, further comprising: transmitting decompressed audio data to a speaker.
